

# ENM7005-B Modelling and Optimisation

## Design of Experiments & Response Surface Modelling

## Module Overview – 2023-24

# About your lecturer...

## Professor Felician Campean

Professor of Automotive Reliability Engineering

Director of Automotive Research Centre

Associate Dean Research & Knowledge Transfer

- Expertise in Systems Engineering, Engineering Design & Product Development, Reliability
- Experience with modelling real world systems – in conjunction with industrial projects
- Extensive experience of teaching statistical modelling methods to industry – the materials used in this module have been developed in conjunction with industry – and taught in industry
  - SAFI Consortium – University of Bradford, Airbus, Renault, PSA, Valeo
- Where you can find me:
  - Room: Chesham B1.34
  - Email: [f.campean@bradford.ac.uk](mailto:f.campean@bradford.ac.uk)

# How do we model engineered systems?

- Think of examples of engineering systems modelling\* problems you have tackled in the past?
  - What was the problem?
  - How did you approach it – how did you model it?
  - How did you validate your model?
  - What was the most difficult part / the most challenging aspect of the modelling?

\*Modelling – we refer here to the mathematical modelling of a system (i.e. the “law” of the system that gives the *function* of the system) rather than its geometrical form...

# Approaches to Systems Modelling

- **Phenomenological Modelling**

- From the fundamental equations of motion, flow, thermodynamics, ...
- Computer / Simulation based

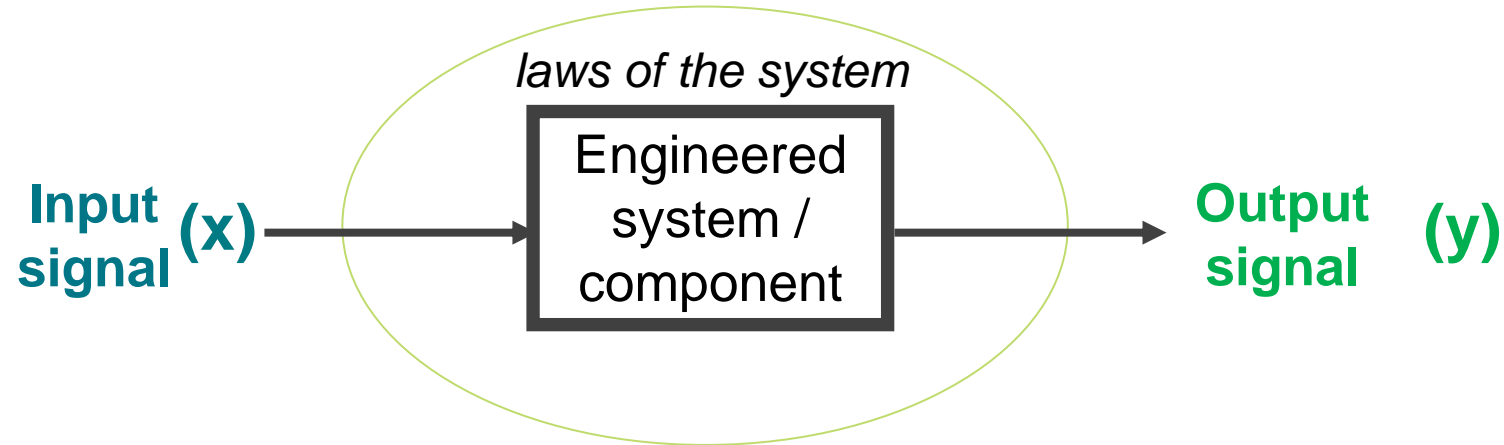

- **Behavioural Modelling**

- “Black Box” modelling of the system
- Empirical modelling – based on data collected from “black box” experiments with the system

- Or based on a simulation model of the system
  - Model reduction, surrogate modelling, etc...

- Abstraction of Engineering activities:

|                  |  |                           |                  |
|------------------|--|---------------------------|------------------|
| <b>Analysis:</b> | Given the <b>system</b> , the <b>input</b> and the <b>laws</b>         | Predict the <b>Output</b> | <u>Deduction</u> |
| <b>Science:</b>  | Given the <b>system</b> , the <b>input</b> and the <b>output</b>       | Derive the <b>Law</b>     | <u>Induction</u> |
| <b>Design:</b>   | Given the <b>input</b> , the <b>laws</b> and the <b>desired output</b> | Design the <b>System</b>  | <u>Synthesis</u> |

Credit: Prof. T.P. Davis, "Science, Engineering and Statistics", Research Seminar, University of Bradford, 2006

# Example: GDI engine calibration problem

## Control Parameters

- Engine speed
- Load demand
- Fuel Pressure
- (Main) Injection Timing
- VCT variables (IVO, EVC)
- Multiple Injection variables (timing, quantity)

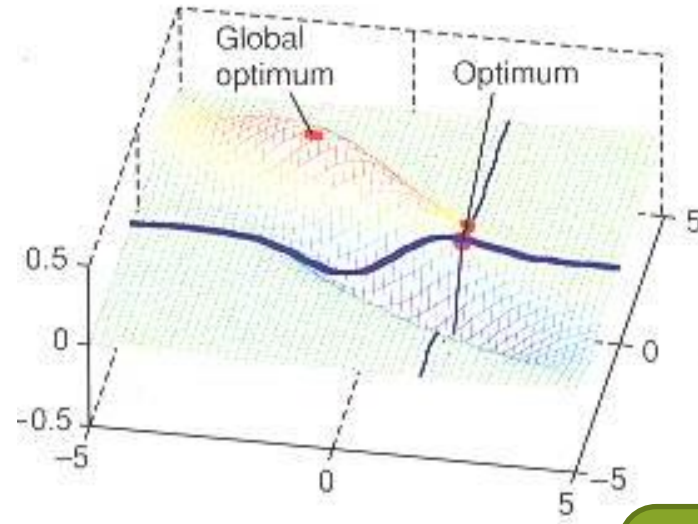

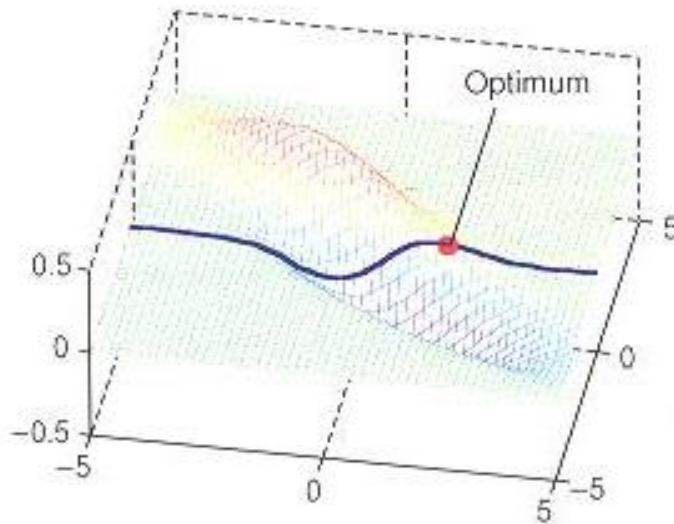

## Responses

- Fuel flow
- Emissions
  - $P_m / P_n$
  - HC
  - CO
  - NOx
- Combustion stability
- Drive-ability
- Engine noise
- Exhaust gas temperature
- ...

- Engine mapping and calibration is best described as multi-objective optimisation problem
  - i.e. find optimal actuator settings to achieve the best trade-off between objectives (power/torque, fuel economy, driveability and noise) while meeting emissions legislation requirements!
- In practice - how do calibration engineers find an optimal setting?

# Example: GDI engine calibration problem

- Traditional approach to engine optimisation is one-variable-at-a-time

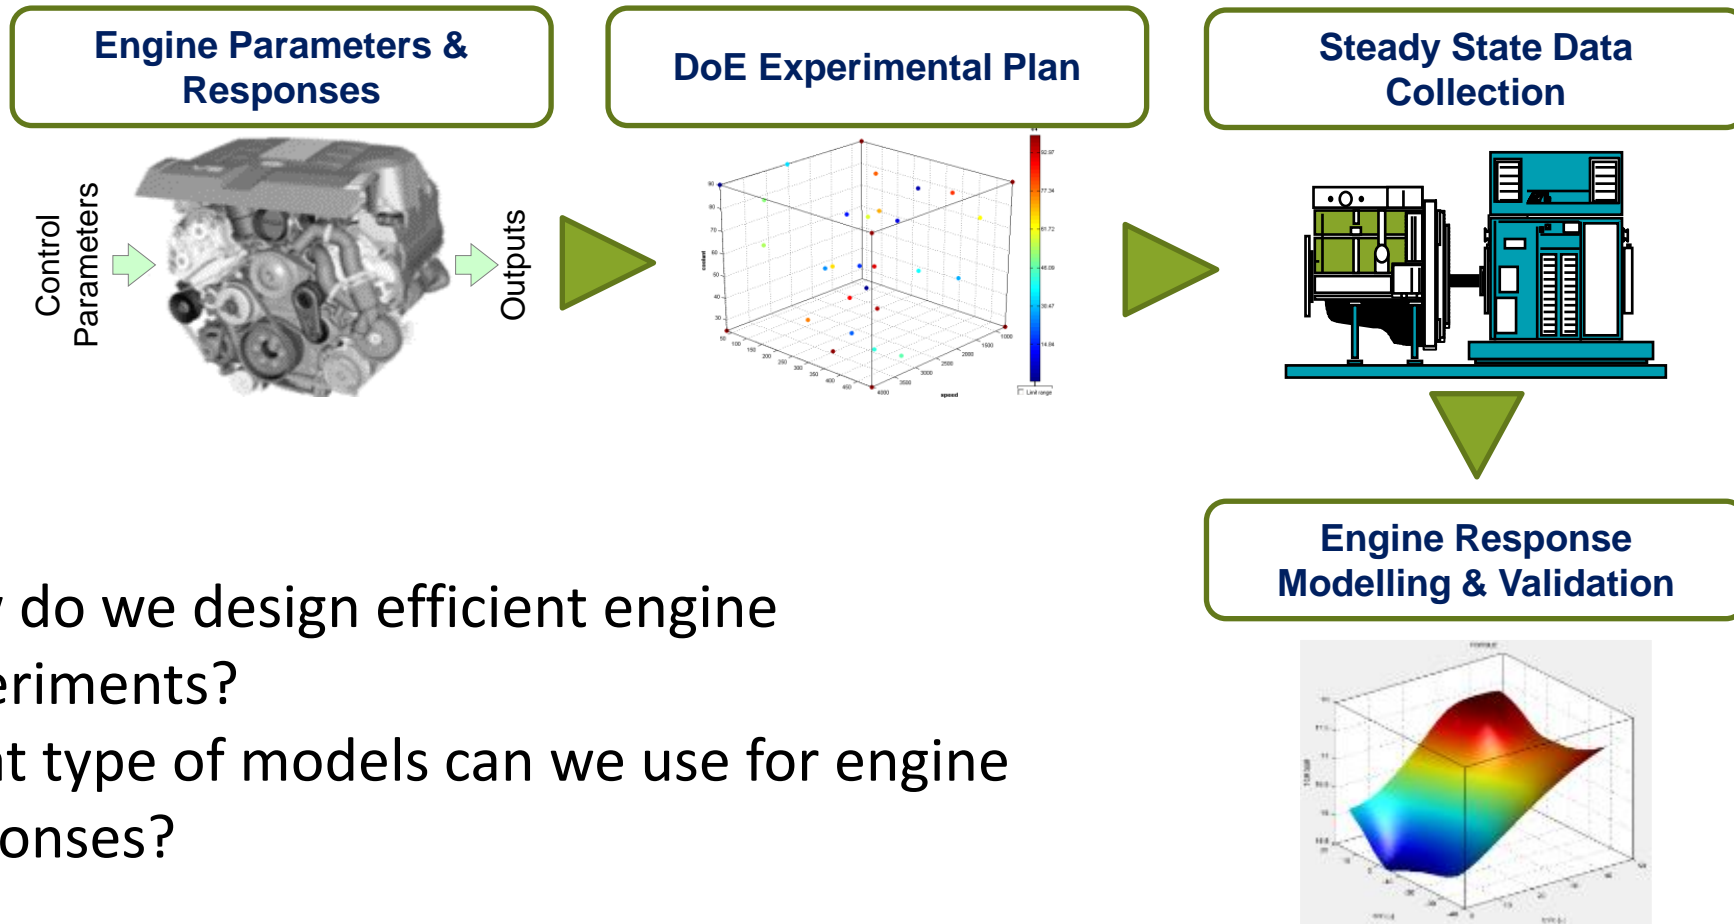

How do we develop such mathematical models?

We need a mathematical model for the engine response (fuel flow, emissions) as a function of the input / control variables

..Such that we can apply optimisation techniques to search and find the “global optimum”

- This is very inefficient and it does not guarantee that the global optimum is found

# Engine Mapping / Model Development

- How do we design efficient engine experiments?
- What type of models can we use for engine responses?

# Response Surface Modelling Approach

1. Plan the Experiment  
(DoE – Design of Experiments)

2. Run the engine experiment / collect test data

# Response Surface Modelling Approach

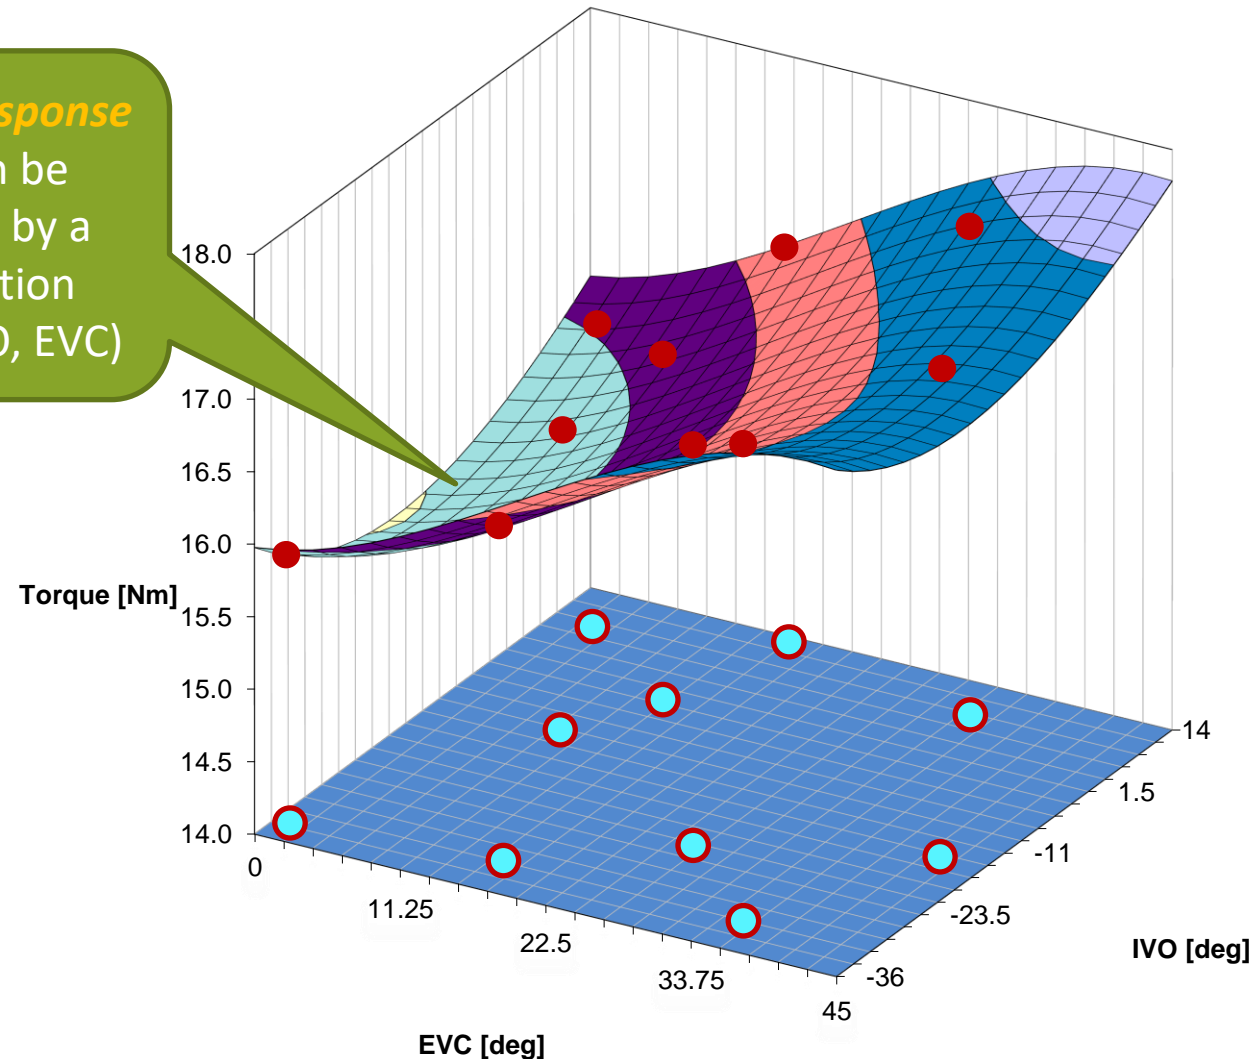

1. Plan the Experiment  
(DoE – Design of Experiments)

2. Run the engine experiment / collect test data

3. Fit the Response Surface

# Response Surface Modelling Approach

This engine **response surface** can be represented by a single equation  
 $\text{Torque} = f(\text{IVO}, \text{EVC})$

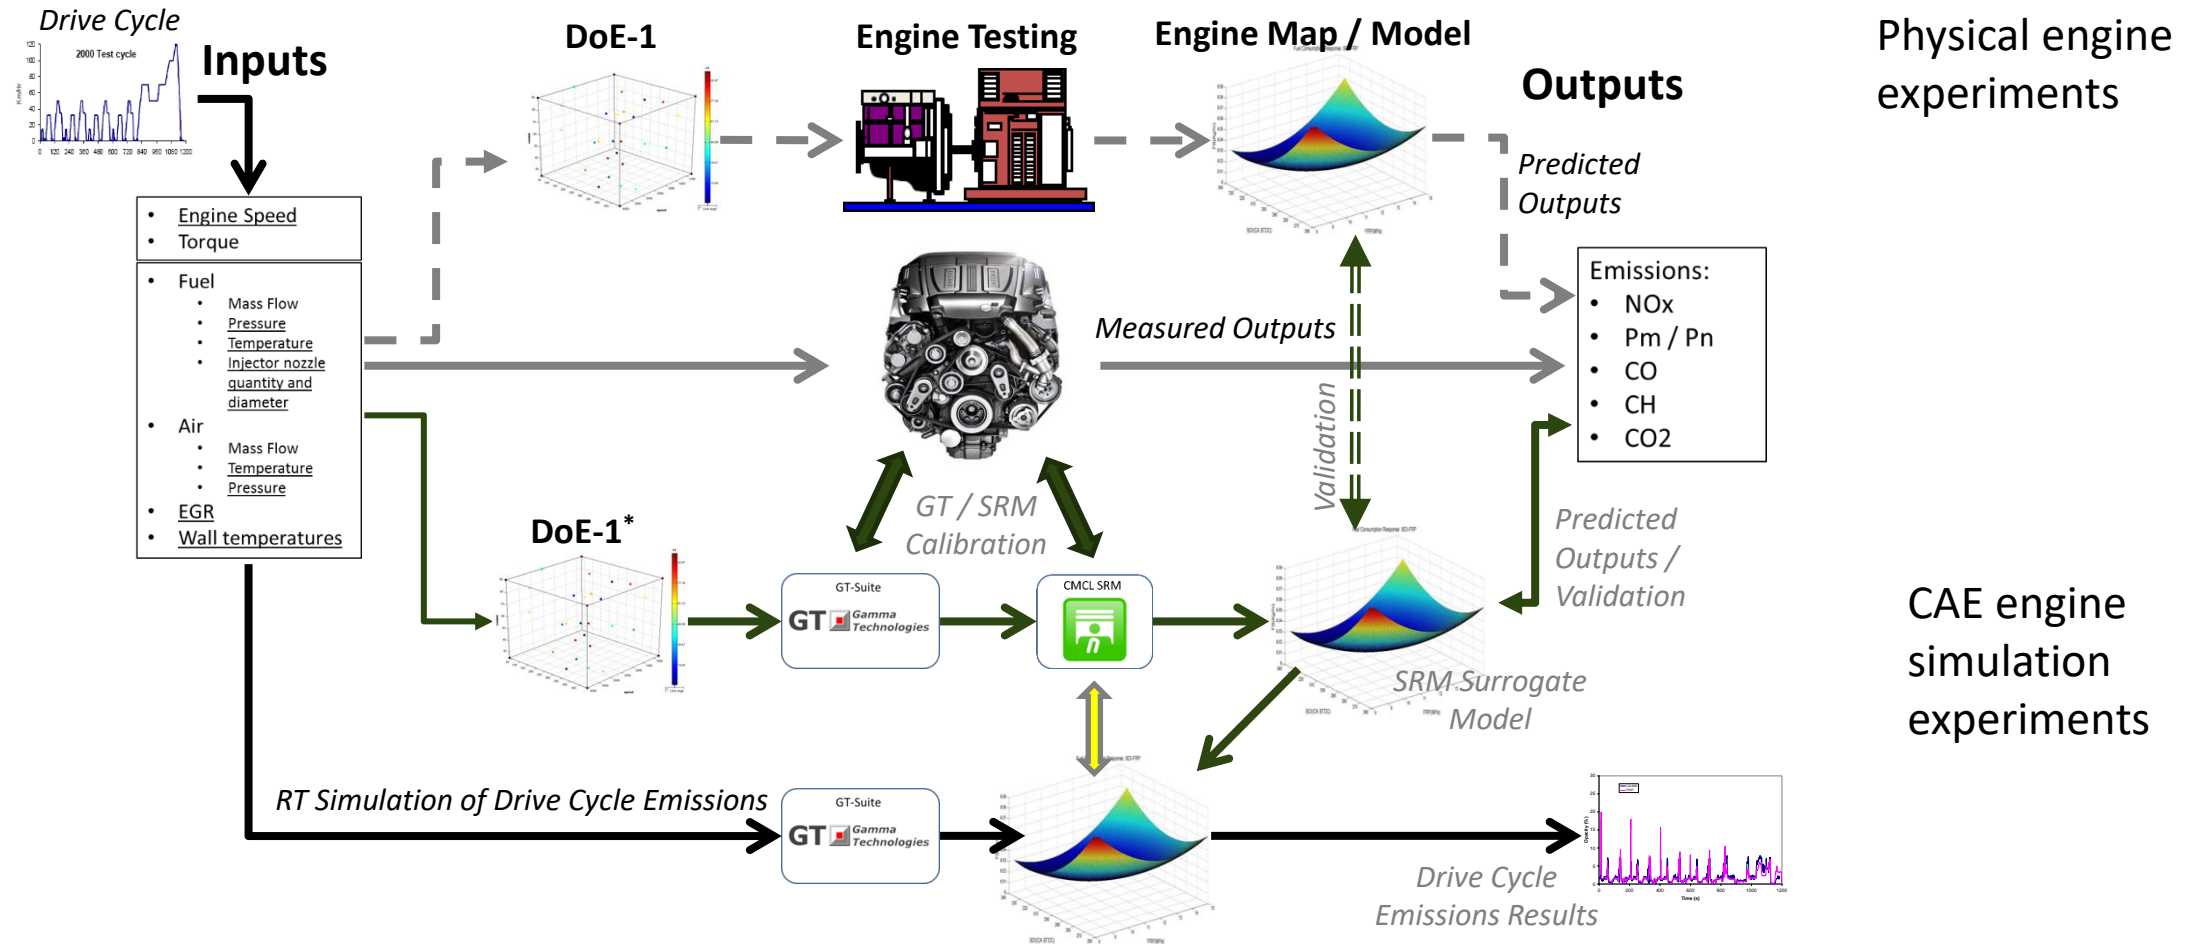

1. Plan the Experiment  
(DoE – Design of Experiments)

2. Run the engine experiment / collect test data

3. Fit the Response Surface

# What if we are dealing with CAE Models?

Evaluation of zero-dimensional stochastic reaction modelling for a Diesel engine application, Int J Engine Research, <https://doi.org/10.1177/1468087419845823>

# Examples of Engineering applications

**Table 1** Summary of literature cases: metamodeling techniques and problem characteristics considered

|                              | Metamodelling technique |         |     |     |    |      |         |     |                   |  | Problem characteristic |              |             |       | Test problem        |                     |                                   |

<https://doi.org/10.1007/s00158-019-02352-1> Performance evaluation of metamodeling techniques: towards a practitioner guide

# Modelling – Course Aims

- Develop Knowledge to master the theory and practice of Design of Experiments and Response Surface Methodology, as applied to Engineering problem-solving and design.
- Develop Skills to be able to plan and run experiments appropriate to a wide variety of Engineering scenarios, fit empirical transfer functions to the resulting data and use transfer functions to understand the impact of variation on system performance.
- Personal Skills - the use software for DoE & RSM analysis
  - **Plan and design** experiments
  - **Build and validate** response models

# Outline syllabus – Modelling (DoE & RSM)

- Principles of empirical / behavioural modelling
- Linear regression
  - Correlation & regression, model quality, model selection
- Planning and analysing designed experiments
  - Planning and analysing 2-levels experiments
  - Multi-level DoEs
- Experiments for surrogate modelling with computer based experiments
  - Latin Hypercubes, flexible response models – including neural networks
- Examples and case studies

## Suggested reading

- Forrester                      Engineering Design via Surrogate Modelling
  - Myers&Montgomery      Response Surface Modelling
  - Montgomery                Design & Analysis of Experiments
  - Grove & Davis              Engineering Quality & Experimental Design
  - Montgomery et al        Engineering Statistics
- 
- UoB / Short Course Handbooks / Materials
    - Advanced Statistics for Engineering
    - Design of Experiments & Response Surface Modelling

# Learning materials

## Short Course Handbooks / Materials

- **Advanced Statistics for Engineering**
  - Most of the short course materials (including tutorials and exercises) will be made available as background reading via Canvas;
  - Please use this as self-study – and bring questions in the classroom to discuss!
  - Some topics (in particular multiple regression) will be covered in the classroom
- **Design of Experiments & Response Surface Modelling**
  - We will largely follow the DoE & RSM short course materials in the Modelling part of this module
  - Most sessions will have tutorials – which are available for you to self-study – and we will discuss these in the class – together with the „exercises“;
  - We will expand on complex modelling – and computer based experiments / surrogate modelling

# Course Organisation

- Technical Sessions (TS)
- Practice sessions (ES):
  - Python “Tutorials”
    - Aim: to develop practical skills and discuss key issues to ensure understanding;
  - Exercise Task
    - Based on practical examples – combination of team based exercises and application of tools to engineering problems
- Self-study needed – use classroom for clarification and reinforcement

# Tutorials

- Tutorials will be based on Python – using Google Colab
  - Python is becoming a programming environment of choice for many engineering organisations
  - It underpins many of the Machine Learning applications commonly used in industry
  - It is a good skill to develop / have...
  - We will provide you with detailed step-by-step tutorial guidelines
- Reference to other software (e.g. Matlab or Minitab) can / will be provided
- Exercises:
  - Each session has an „exercise“ – based on the tutorial – giving you an opportunity to develop and practice your skills (by modifying the code)
  - You will be asked to submit your exercise files through Canvas
    - This will not be individually marked – but collectively will provide an engagement and skills contribution mark to the modelling coursework – **10% of the mark**
    - Feedback comments / notes will be provided across the class

# Modelling Project / Coursework

- Assessment for the modelling part is based on an individual coursework
  - The coursework will be based on an engineering modelling „problem“ of choice
  - A reference problem / task will be provided, but students are encouraged to choose their own technical example
  - The coursework brief will be discussed in **week 6** – once the relevant material (both technical and tutorials / code support) is covered
  - In your technical report you will have to follow the methodology covered in class; you will be expected to apply the methodology independently to the given or chosen technical problem, justify your approach to the designed experiments – including critical considerations for the choice of parameters, experimental strategy, and the fit and analysis of a response surface model and its use – for optimisation!
  - Students can work together, but the reports are individual!
- Coursework submission will be in Week 12 (TBC)
- The timetabled sessions for the last 3 weeks will be devoted to „coursework clinic“

# Summary - Delivery, assessment and feedback

## Delivery

- Lectures / Tutorials  
see timetable for the weekly schedule
- Technical sessions front-loaded; coursework set up in week 5 with support later in the semester.

## Assessment

- Modelling Coursework - 50% of the overall module mark
  - Technical report on your modelling experiments that you will conduct

## Feedback

- Tutorial classes
- Formative assessments

## Canvas

- All materials will be available in Canvas – see the Modelling section
